

Engineers insisted they needed to boost the water 40 PSI and provide 100 GPM in this restaurant chain.

There wasn't enough space to house any other known prefab pump and time was critical which eliminated all other custom designed systems.

Towle-Whitney's variable speed system, the VFBooster, was offered as a solution.

We recommended 40 PSI boost at 40 GPM with the understanding if the pump was too small, a second compact model could be added to meet the pressure and volume demands. The Yikes Variable Speed Systems are designed for modular concepts with one, two or three being added together to get the desired results.

As you can see from this picture, clearly space was a consideration. We opted for the single unit model versus the double model unit. Fortunately, it met the actual pressure and volume needs.

The Yikes Variable Speed Pumps are quiet, powerful, compact and readily available.

The engineers were delighted by the pump's performance. Due to our experience in boosting low water pressure, we were able to deliver the right solution at the right price for our customer.
